## With valuable lenses...

Value in CCTV lenses sought by the next generation - they should be more sophisticated and reliable.

Lenses from SPACE inc. have been recognized by various customers as providing good value and meeting any needs throughout the world with Made-In-Japan quality and global-standard prices.

The company is represented by numerous 'star-related names' related to key products in its line-up.

Our products are ever-reliable, shining with stellar quality, and we will continue our research to keep providing such products.

With valuable lenses ... We are SPACE inc.

SPACE inc. is a dedicated manufacturing company for CCTV lenses founded in 1984. All processes, from designing to processing (polishing, coring), coating, processing of metallic parts, mold building, printed circuit board mounting, and product assembly, are carried out in-house, in a fully-integrated environment.

The headquarters in Mitaka City, Tokyo, is the centre for development, production management, quality assurance, sales and marketing and mold building, while a factory in Ootawara City, Tochigi Prefecture, takes care of lens processing, coating, print circuit board mounting and product assembly functions.

SPACE inc. offers approximately 170 types of CCTV lenses; for example, megapixel day and night lenses for IP cameras, day and night vari-focal lenses for commodity facilities, Super telephoto motorized zoom lenses for national border monitoring, motorized zoom lenses for car number recognition, motorized zoom lenses for street surveillance, 5 megapixel lenses for machine vision, and 3.6 megapixel motorized zoom lenses.

Our policy is 'Quality First', so we design, process, assemble, and manage our products making quality our first priority. We focus completely on our 'core manufacturing technology', maintaining performance and durability into the future.

## [Perspective]

- Both security cameras and machine vision FA cameras are evolving toward "better picture" capabilities. As for lenses, the 'input gate' for the picture, "higher definition" is always required. SPACE inc. aims to be a 'lens maker for high image quality' based on our original abrasive and AR multicoating technology, leveraging ED glass, aspheric lens, etc.
- We make the most of our advantages as an integrated manufacturer that gives us the agility and flexibility to handle special lenses and custom-made products specific to our customers.
- We will continue to enhance our line-up of affordable, easy-to-use, high performance motorized zoom lenses to meet market needs.

3.6MP High Resolution Power 3.6Megapixel

The entrance pupil of a zoon lens changes in diameter as the focal length is changed. As you zoom toward the telephoto end, the entrance pupil gradually enlarges. When the entrance pupi diameter is equal to the diameter of focusing lens group, it cannot become any larger, so the Fnumber drops. To eliminate F drop completely, the focusing group has to be larger than the entrance pupil at the telephoto end of the zoom. It has to be at least equal to the focal length at the telephoto end divided by the F-number.

## Low dist Controlling distortion at low levels.

CAPELLA has controlled distortion at low levels.

CAPELLA has achieved over $125 \mathrm{lp} / \mathrm{mm}$ resolution $(4.0 \mu \mathrm{~m})$ around the periphery as well as in the center.

| NON |
| :---: | :---: |
| F-DROP | Maintaining F-number

AR multi layer coating assists to reduce a harmful flare and ghosting, which can deteriorate the image. CAPELLA has succeeded in completion of an AR multi layer coating which realizes high transmittance at wide wavebands from a visible ray to a near IR ray through unique improvements of our own in addition to the change from conventional single laye coating to multilayer coating.

## MULTI CONTROL <br> Various control methods

Various control methods are implemented for the new lens, allowing for system expansion.

## 5Megapixel Lenses

Resolution Power/5 Megapixel

PYXIS has achieved over $145 \mathrm{lp} / \mathrm{mm}$ resolution around the periphery as well as in the center.

PYXIS has controlled distortion at low levels.

PYXIS has succeeded in completion of an AR Multilayer Coating which realizes high transmittance at wide wavebands from a visible ray to a near IR ray through unique improvements of our own in addition to the change from conventional Single layer Coating to Multi layer Coating.

## Click Iris mechanism

The Iris adjustment is accurate and easy to handle.

It provides a Lock Screw fitted as the standard equipment in Focus and Iris, and 3 taps at every $120^{\circ}$.

It provides a Lock Screw for both the Focus and Iris.

## High light volume rate

The light volume rate is high from the center to the periphery of the lens.

PYXIS25:-0.01\%

## Mount Slip mechanism

It is possible to control the lens position freely by using the Slip mechanism.

Multi IRIS structure has more diaphragms than the conventional IRIS and the form of the diaphragm is similar to a circle. Compared to the conventional IRIS, more accurate and even uniform control is possible.

The excellent vibration-proof structure proves its true strength in a vibrating environment. PYXIS

CIRCUIT DIAGRAM

| IMAGE SIZE
Image size of lens. Check the image sensor of the camera you use.

## |MOUNT

Lens mount is broken into 2 categories: C Mount and CS Mount. The flange backs of them are different as shown in the picture below. Loading CS-C adaptor (sold separately) onto C Mount lens enables the C Mount lens to be used for CS Mount camera.
[CS-Mount]

[C-Mount]

## FOCAL LENGTH

The distance from the principal point to the imaging surface is called "focal length". The larger value makes it telescopic while the smaller value makes it wide-angle. In other words, the focal length is linked with the field angle.

## F No.

F No. is a unit representing the luminance of a lens. The smaller the F No. means the lens is more luminous. F No. is determined by the ratio calculated with the effective diameter of the lens (the size of the window) and the focal length (the depth of the room). A room in which the window is larger and the depth is shallower is more luminous than a room in which the window is smaller and the depth is deeper.

F No. =Focal Length/Effective Diamete

## |ANGLE OF VIEW

The angle of view is the maximum range where the lens can project its image and is displayed by a degree. The longer the focal length becomes, the narrower the angle becomes; while the shorter the focal length becomes, the wider the angle becomes.

## OBJECT DIMENSION AND CALCULATION OF FOCAL LENGTH

Example: When a $1 / 3$ inch camera has a lens for which the focal length is 20 mm and the object dimension is 5 m , how much range can be shot? $Y=4.8 \mathrm{~mm}$ (horizontal direction) Substitute WD $=$ $5^{*} 1000 \mathrm{mmf}=20 \mathrm{~mm}$ into above formula. $O D=4.8^{*}$ $\left(5^{*} 1000 / 20\right)=1200 \mathrm{~mm}$ Answer: A range of 1200 $\mathrm{mm}(1.2 \mathrm{~m})$ can be shot filling the entire screen of the monitor.

Example 2: If you want to shoot a car including its full width (approximately 2 m ) from a distance of 20 m by using a $1 / 3$ inch camera, which lens should you choose?
Substitute $Y=4.8 \mathrm{~mm}, W D=20^{*} 1000 \mathrm{~mm}$,
$O D=2^{*} 1000 \mathrm{~mm}$ into above formula.
$\mathrm{f}=4.8^{*}\left(20^{*} 1000 / 2^{*} 1000\right)=48 \mathrm{~mm}$

## | DISTORTION

The subject may go out from the ideal image point and the scaling relationship can be broken. A rectangle may be distorted into a barrel or pincushion form, this phenomenon is called "distortion".

TV. $\operatorname{Dist}(\%)=\triangle h / h * 100$

## |COATING

A lens excites a reflex by $4-10 \%$ on its surface. Therefore, a zoom lens or Vari-Focal lens, which consists of a number of lenses, has a huge loss when the ray passes. Moreover, the reflected ray, when hitting another lens surface and reflecting on the complicated inside, causes flare and ghost, which ultimately deteriorates the image. Coating makes it possible to reduce the reflection and protect the lens surface.

SPACECOM employs AR multi layer coating for part of its lenses and implements coating which has high transmittance for a wide range of wavelengths between visible ray and near-infrared ray.

## |RESOLUTION

There is an evaluation for resolution to access the performance of the image formation. A dedicated projector is used to measure how many lines per 1 mm this can be resolved. A combination of white and black lines is regarded as a pair for this resolution. It is important that a constant resolution is kept from the centre of the screen to the edge.

## | MTF

This is the acronym for Modulation Transfer Function. This is a method to evaluate the performance of image formation, as well as for what the resolution does. While the resolution evaluates "the limit of resolution", MTF quantifies the contrast of image formation electrically, for which a black and white pattern chart is used. The larger the contrast ratio becomes the higher the MTF percent becomes.

## |RELATIVE ILLUMINATION

F No. represents the amount of light aggregating into the centre of the lens. The entrance pupil of the lens is a circle in the centre and oval at the edge because part of the peripheral light is trimmed due to the lens tube. (This phenomenon is called "vignetting".) Also, obeying the cosine fourth law, the amount of peripheral light decreases in proportion to the fourth power of the cosine of the field angle, the edge becomes darker compared to the centre of the lens

The more you narrow down the iris the stronger the peripheral light becomes due to decreased influence of the vignetting

## |DEPTH OF FIELD

As long as the size of the blur does not exceed a certain size, we cannot recognize that the image is blurring. It seems to be visually in focus though it's a blur in theory. The size, which is not recognizable as a blur, is called the "permissible circle of confusion". The permissible circle of confusion is not constant and depends on image sensors, monitors, shooting conditions, etc. However, the following table can be used as a guide.

| Image Size | Permissible Circle of Confusion |
| :---: | :---: |
| 1 inch | 0.03 mm |
| $2 / 3$ inch | 0.021 mm |
| $1 / 2$ inch | 0.016 mm |
| $1 / 3$ inch | 0.011 mm |
| $1 / 4$ inch | 0.008 mm |

Focal Depth
Depth of Field d1+d2

```
Working Distance: WD Focal Length: \(f\) F No.: F Permissible Circle of Confusion: C
```

Front Depth of Field d1 $=\left(C^{*} F^{*} W D\right) /\left(f^{*}+C^{*} F^{*} W D\right)$ Rear Depth of Field d2=(C*F*D)/( ($\left.^{*} \ddagger C^{*} \mathrm{~F}^{*} W D\right)$ Depth of Field $=\mathrm{d} 1+\mathrm{d} 2$

## FOCUS ADJUSTMENT

As described in the section DEPTH OF FIELD, the smaller the F No. of the lens becomes (the more the iris opens), the narrower the depth of field becomes. If a lens is installed and the focus is adjusted when there is daylight, it means it's adjusted at a certain position in the wide range of depth of field. Especially, in case of auto iris lens, the iris will operate to open in the evening and the depth of field will be decreased. If the focus was not adjusted at the best point, the blur would be outstanding. To prevent this phenomenon, we recommend you open the iris as much as you can and deliberately narrow the depth of field when you adjust the focus. To open the iris, it is convenient to load an ND filter in front of the lens.

Adjusted Focus Position

In the evening, the iris is operated to open and the depth of field is narrowed. As a result, it blurred.

Adjusted Focus Position
| CONTROL OF ELECTRIC ZOOM LENS

SPACECOM electric zoom employs Common methods as is standard. (It is also possible to handle Independent methods.) In case of Common methods, when $\mathrm{DC}+6.4 \mathrm{~V}$ is applied to Terminal 2 , the iris will operate to close. Because the motor will continue to revolve as long as the voltage is applied, you should stop applying at the objective position. To operate to open, apply $D C-6.4 \mathrm{~V}$ to Terminal 2 . To operate the focus, use Terminal 3 . Applying $\mathrm{DC}+6.4 \mathrm{~V}$ makes it operate to go FAR (Infinite direction) and applying DC 6.4V makes it operate to go NEAR (proximate direction). To operate the zoom, use Terminal 4. Applying $\mathrm{DC}+6.4 \mathrm{~V}$ makes it operate to be wide-angle, while applying $\mathrm{DC}-6.4 \mathrm{~V}$ makes it operate to be telescopic.

## | POTENTIOMETER

Loading a potentiometer onto the electric zoom lens enables you to know the current positions of focus, zoom and iris. Leveraging this function enables preset control, servo control, and control via computer. The potentiometer has 3 terminals as shown in above picture. If a voltage is input into both ends of the operation range, the current positions will be fed back as the voltage value. For example, suppose you apply $O V$ to the wide-angle end $(f=10 \mathrm{~mm})$ and 100 V to the telescopic end ( $f=$ 100 mm ) (Both ends of zoom), while applying the zoom motor to the drive. As a result, the current position of the zoom will be fed back with the range between OV and 10 V . Configure the voltage between 0 V and 10 V , and the corresponding focal length $(0 V: f=10 \mathrm{~mm} \quad 1 \mathrm{~V}: f=20 \mathrm{~mm} \quad 2 \mathrm{~V}: \mathrm{f}=30 \mathrm{~mm}$
$3 \mathrm{~V}: \mathrm{f}=40 \mathrm{~mm} \quad 10 \mathrm{~V}: \mathrm{f}=100 \mathrm{~mm}$ ). Establish a system using the relationship between the voltage and the focal length. Then, the system will not only recognize the current positions but also operate the zoom automatically only by inputting the required focal length.

## | MEGAPIXEL LENS

SPACECOM's megapixel lens defines the resolution required for a lens based on the pixel pitch of the image sensor of a camera. For example, if it's $2 / 3$ inch 5 megapixel, the pixel pitch of the image sensor is $3.45 \mu \mathrm{~m}$. Therefore, $3.45 \mu \mathrm{~m}$ is required as the resolution of the camera. That is, there are 145 lines/mm.

## | ASPHERIC LENS

A spherical lens cannot make parallel rays converge into one point perfectly on the optical axis. An aspheric lens is a lens in which the surface is aspheric to allow the rays to converge into one point on the axis. An aspheric lens enables aberration correction, downsizing lens and large diameter.

Spherical Lens

Aspheric Lens

## |ED GLASS

In case of general optical glass, the longer the focal length is the more difficult the colour aberration correction is. The second spectrum volume increases in visible light and near-infrared light ranges, which makes the focal point stray further. In case of ED glass, the second spectrum volume and the divergence are small so that the misalignment is refrained. This is very useful material for a Day \& Night lens and a lens which has a longer focal length
